Elisa Esguerra Campus

Development of Web-Based File Management System exclusive to Faculty in AUEEC for Enhanced and Efficient Record Administration

A Research Proposal Presented to the Faculty of the Senior High School Department Arellano University - Elisa Esguerra Campus
Malabon City

In Partial Fulfillment of the Requirements for the Subject
SPEC 1- COMPUTER PROGGRAMING 3 and SPEC2 - COMPUTER PROGGRAMING 4 Information and Communication and Technology (ICT)

CHAPTER I
INTRODUCTION

1.1 BACKGROUND OF THE STUDY

As workloads have increased over the years of developing systems for bringing efficient storage, organization, and retrieval of data for consumer use, this has resulted in greater complexity and demand for the volume of data shared by users, the manual method of storing data have often led to failure and inefficiencies of handling data, which in turn affect productivity. It highlighted the need for efficient archival systems to preserve institutional memory and facilitate research **(Smith & Johnson 15**).To address these challenges — Software Developers have created a file management system, designed to manage, store, manipulates files and data such as documents and records. This system offers more efficient, quick accessibility for handling files, and improved user interaction and more flexible organization for users **(Rabulan, R. G., & Glina, J. P. L. 2025)**

The recent integration of technological devices in education has led to the development of Learning Management Systems (LMS), which streamline student learning and provide a centralized digital hub for tracking educational progress. At Arellano University - Elisa Esguerra Campus, we have implemented our own Learning Management System for student use; however, faculty members lack a similar system, resulting in a slower and less organized workplace environment. The digital age necessitates that organizations adapt to more efficient and automated processes. In higher education, faculty handle substantial volumes of documents related to accreditation, performance evaluations, and research. Unfortunately, many institutions continue to rely on manual or disconnected digital systems, which can lead to limited storage capacities, potential loss of information, and time-consuming retrieval processes.

By developing a web-based file management system exclusive to the faculty this research aims to address the identified challenges, This system will serve as a centralized, secure, and user-friendly platform for managing all academic and administrative records. The proposed solution leverages modern web technologies to provide a comprehensive approach to file organization, storage, retrieval, and sharing. and have a streamline administrative processes, and contribute to the overall improvement.

1.2 OBJECTIVES / PURPOSE OF THE STUDY

The main goal of this system is to enhance the efficiency and productivity of faculty members by providing them with a web-based platform that allows them to effectively organize, store, and manage files related to their professional responsibilities. Through the use of this system, faculty members will be able to easily access their documents anytime and from any location with internet connectivity, reducing the time spent searching for files and minimizing the risk of misplacing important documents. This approach aims to simplify daily work processes by creating a structured and organized digital environment where files can be systematically arranged, categorized, and separated according to their purpose or function. By implementing this system, faculty members can manage documents such as reports, teaching materials, administrative forms, and other work-related files more efficiently. Ultimately, the system is designed to make work processes faster, more convenient, and easier to manage while promoting better organization, improved workflow, and increased overall productivity within the institution.

The objective of this study is to develop a web-based File Management System that enables faculty members to easily access and manage their work-related files anywhere with an available internet connection. The system will function as a centralized platform where faculty members can handle and organize documents associated with their professional responsibilities.

The study also seeks to demonstrate how implementing a system similar to the Learning Management System (LMS) can help in enhancing the productivity of faculty members by answering the following questions:

1. What are the benefits of developing a web-based system for faculty related tasks such as storing and retrieving recorded data?
2. How does this system differ from the **Learning Management System (LMS) of Arellano University - Elisa Esguerra Campus (AUEEC)?**
3. How does this affect the Faculty Members of Arellano Elisa Esguerra Campus (AUUEC) compared to the Student's Learning Management System (LMS)
4. Does it positively affect the faculty members?
5. Does it make the faculty member's work more efficient?
6. How advantageous is it to their work and why?
7. Are the objectives specific and measurable?
8. Can these objectives realistically be achieved within your time frame?
9. How will each objective be addressed in your methodology?

1.3 SIGNIFICANCE OF THE STUDY

The goal of this study is to create a system which will provide Faculty Members with a user-friendly and organized website for managing their files, documents, and records. The findings in this study aims to help identify what flagging Faculty works related to data management and to remedy the inefficiencies.

BENEFICIAL TO WHOM

FACULTY MEMBERS OF AUEEC.
They will be the primary beneficiaries if this study since the system is exclusively-designed for them. It will help them manage academic and administrative records more efficiently, reduce paperwork, and save time in retrieving important documents.

AUEEC ADMINISTRATION.
The administration will benefit from improved record organization, better monitoring-of documents, and enhanced data security. This can support smoother operations and-better decision-making.

FUTURE RESEARCHERS AND IT-STUDENTS.
This study may serve as a reference for future researchers who plant to develop-similar web-based systems. It can provide ideas, design concepts, and implemation-strategies for related projects.

STUDENTS OF AUEEC.
Although the system is exclusive to faculty members, students may indirectly benefit-from improved efficiency in record management. Faster processing of academic documents, grades, and other faculty-related files can result in smoother academic transactions and better service delivery.

THE INSTITUTION AS A WHOLE.
By promoting digital transformation, the system contributes to the modernization-of record management practices within AUEEC, improving overall institutional-efficiency.

1.4 SCOPE AND DELIMITATION

SCOPE

This research focuses on creating a website for the Arellano University Elisa Esguerra Campus to help manage files and records. The main goal is to make record keeping faster and easier by moving from paper to digital files. Different people will have different access levels, including system administrators, faculty members, and students. Each group can only see or change what they are allowed to based on their access level on the website.

The proposed system will include essential features such as user login and authentication, file uploading and downloading, file categorization, and a search function to help users easily locate their stored documents. The system will allow faculty members to manage files such as lesson plans, reports, instructional materials, grading records, and other academic documents related to their responsibilities.

Additionally, the system will provide an organized interface to improve document management and reduce the chances of losing important files. The study will primarily focus on the design, development, and basic functionality of the system. It will evaluate how the system can help faculty members improve file organization and accessibility in their daily academic tasks. Feedback from selected faculty users may also be gathered to assess the usability and effectiveness of the system.

DELIMITATION

However, this study has several limitations. The system will only be accessible to faculty members of AUEEC and will not be intended for students or external users. The system will be limited to basic file management functions and will not include advanced features such as real-time collaboration, integration with other institutional systems, or mobile application support. In addition, the research will only evaluate the system within the scope of the selected users and will not cover the implementation across other campuses of Arellano University The system is only for the Elisa Esguerra Campus and will not connect to other Arellano University branches.
